

Location Intelligence in Healthcare

Product Offering

Live Positioning

A multi-platform indoor location system without the need for additional infrastructure.

Live Routing

Intelligent and accessible routing throughout indoor and outdoor spaces.

Live Location

Locate people or assets in real time – Tightly integrated into end user solution and GDPR-compliant.

Live Mapping

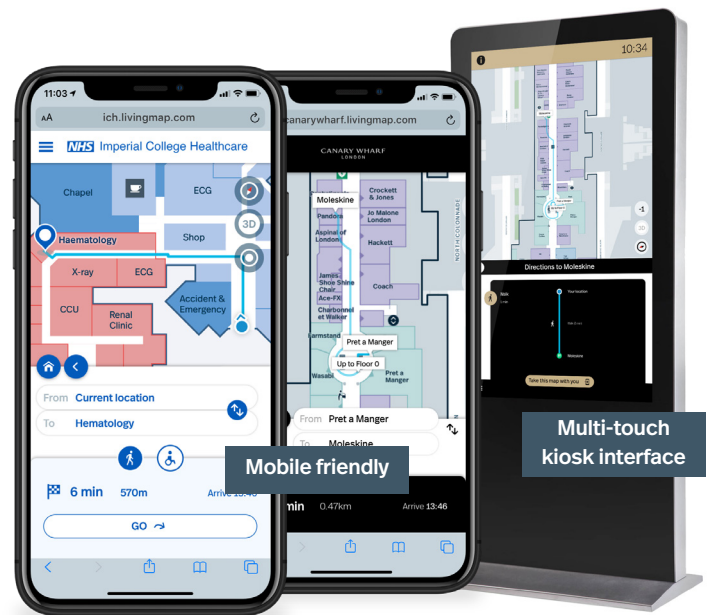

Feature rich mapping and cartography platform integrated across all our products.

Our SaaS product suite is designed to ensure quick integration and to provide value, while making it easy to add additional services as needs grow.

- Hospital Campuses are large complex spaces for both patients and staff, particularly under stress. In a [2015 study](#) of 300 doctors, more than half reported getting lost on the way to a code blue. In addition, as much as 15%^[1] of missed appointments are due to patients unable to find the right room once they reach the hospital.
- Missing assets in hospitals and allocation of assets such as beds can have a significant negative impact on time and efficiency.
- Contact tracing amongst ancillary staff can help identify and manage potential exposure incidents, keeping staff, patients and visitors safer.
- Dispatching staff for patient care and administrative tasks such as a porter for patient transfer or discharge is currently handled in an inefficient way with no regard for the proximity of staff to patients.

Living Map have developed a combination of solutions and products solving wayfinding, patient experience, asset tracking and staff dispatch in healthcare, which can improve patient wellbeing and trust, improve staff efficiency and productivity, and reduce accidental exposure to secured and quarantined areas.
